Migrating a Voiceflow v3 project to v4 with Claude

A user guide for the voiceflow-v3-to-v4 plugin, version 0.2.0.

What the plugin does

A v3 agent is a set of intents wired to flows. A v4 agent has a global prompt, routing instructions, and skills: playbooks for conversations and workflows for fixed sequences. Voiceflow has no automatic converter between the two, and its migration guide recommends rebuilding in v4 with the v3 project as the specification.

The plugin does that rebuild with you, in four steps:

1. **Audit.** Claude reads your .vf export and lists everything the agent does: topics, components, intents with their example phrases, entities, variables, API calls, AI steps, and anything that needs a person to decide.
2. **Plan.** Claude proposes a v4 design and saves it as a file. Nothing is built until you approve it.
3. **Build.** Claude creates a new v4 project in the workspace you choose. Your v3 project is never changed.
4. **Verify.** Claude runs test conversations for each former intent and writes a migration report.

What it does not do

- It does not copy your v3 project one to one. The default mode redesigns it the way v4 is meant to work.
- It does not move knowledge base documents. A .vf export does not contain them, so you add your sources again.
- It does not copy API keys. Any key found in the file is hidden and replaced by an empty secret that you fill in.
- It does not publish. You review the new agent in the Creator and publish it yourself.

Before you start

You need:

- Claude Code, or a Claude app that supports plugins.
- A Voiceflow account with access to the workspace where the new project will go.
- The Voiceflow MCP server connected to Claude. It uses a browser sign-in, so there is no key to copy. Setup: https://www.voiceflow.com/docs/mcp/setup
- Python 3, if you want Claude to run the audit script (it ships with the plugin and needs no other packages). Without it, Claude reads the file directly.
- Optional: the vf command line tool, for people who prefer the terminal. Install: https://www.voiceflow.com/docs/cli/install

Install the plugin

In Claude Code:

```
claude plugin marketplace add voiceflow-gallagan/voiceflow-claude
claude plugin install voiceflow-v3-to-v4@voiceflow-claude
```

In other Claude apps that support plugins, add the repository voiceflow-gallagan/voiceflow-claude as a plugin marketplace, then install voiceflow-v3-to-v4.

Export your v3 project

1. Open the Voiceflow dashboard.
2. Open the menu on your v3 project and choose Export.
3. Save the .vf file somewhere you can give to Claude.

Keep this file private. It can contain API keys and customer data. Do not commit it to a repository or share it in a public channel.

Run a migration

Give Claude the .vf file and ask:

> *Migrate this Voiceflow v3 project to v4.*

Step 1: read the audit

Claude shows a summary and saves the full audit as a Markdown file. Look closely at these parts:

- **Credentials found in the file.** Each one is listed by location, never by value. If the file held real keys, rotate them with the provider, because anyone who had the file could read them.
- **Intents.** These become the routing rules and the test cases. Missing or odd intents are easier to fix now than later.
- **Needs a human.** Custom actions, code steps, AI steps and voice settings that need a decision from you.

Step 2: choose a mode and approve the plan

Claude asks which mode you want:

- **Redesign (default).** The agentic v4 approach that Voiceflow recommends. Conversational tasks become playbooks, routing moves into instructions, FAQ content goes to the knowledge base, and workflows are kept for tasks that must run in a fixed order.
- **Faithful port.** Each v3 topic and component becomes a workflow with matching steps. Closer to what you had, but less flexible.

The plan lists the project name and channel, the global prompt, one row per v3 topic with its v4 target, the routing rules, tools and secrets, variables, and the test cases. Read it, ask for changes, and approve it when it looks right.

Step 3: the build

Claude creates the project, variables, secrets, tools, playbooks and workflows, writes the global prompt and routing instructions, and compiles the agent. It keeps a build log with every ID it created. If a step fails in a way it cannot explain, it stops and tells you.

Step 4: verification and report

Claude runs scripted test conversations: each former intent, a multi-step path such as editing or cancelling, an off-topic question, and a goodbye. The report shows which skill answered each test, what was rebuilt, and what is left for you.

After the build: your checklist

1. **Fill in the secrets.** Open the project in the Creator and paste each key into the secret Claude created. Use new keys if the old ones were in the file.
2. **Add your knowledge base.** Add your source URLs, sitemaps and files, then make sure the knowledge base tool is switched on.
3. **Review the manual items** from the report, such as custom actions that a website or app used to handle.
4. **Talk to the agent** in the Creator. Try the phrases your users actually type, not only the test cases.
5. **Publish** when you are happy with it, and update your widget or integration to point at the new project.

How v3 pieces map to v4

v3	v4
Intent and its example phrases	A routing rule in the agent instructions, plus test cases
Topic or flow	A playbook (conversational) or a workflow (fixed order)
Component	A playbook or a sub-workflow
Text, Speak, Random	Playbook instructions, or a Message step
Capture, Choice, Prompt	A playbook that asks and understands the answer
AI Response	Playbook instructions, or a Message step in Prompt mode
AI Set	A structured output, an Operator step or a playbook
API step	An API tool attached to the skill that uses it
Code step	A Function tool
Condition, Set	Playbook rules, or Condition and Set steps in a workflow
Buttons	The Buttons system tool
Custom action	Manual review

Troubleshooting

Claude says it cannot read my project in Voiceflow. That is expected. v3 projects cannot be read through the Voiceflow MCP server or the vf tool. Export the .vf file and give Claude the file.

The audit lists unknown step types. Older or rare steps the plugin has not met yet. They are listed for manual review and the rest of the migration still works. Please report them on the GitHub repository, without attaching your file.

A test sends the user to the wrong skill. Ask Claude to adjust the playbook description (what it does and when to use it) or the routing rule, then run the tests again.

The agent asks "Anything else?" twice. A playbook asked and then handed control back to the main agent, which asked again. Ask Claude to add a rule against repeating the closing question.

My voice project sounds wrong. Voice projects are built as phone-call projects. Review the voice, speech recognition and reprompt settings in the Creator; this part is not yet tested.

Privacy and security

- The audit runs on your machine or in Claude's workspace. Apart from Claude reading it, the plugin sends your .vf file nowhere.
- Credential values are never printed, copied into the new project, or written into the reports.
- The new project is created in the Voiceflow workspace you choose, with your own Voiceflow sign-in.

About

voiceflow-claude is a community project, not an official Voiceflow product. Source, issues and updates: https://github.com/voiceflow-gallagan/voiceflow-claude
